HDD Installation Guide

HP EliteDesk 800 G6 Mini 65 W • Hardware + Windows setup

BEFORE YOU BEGIN

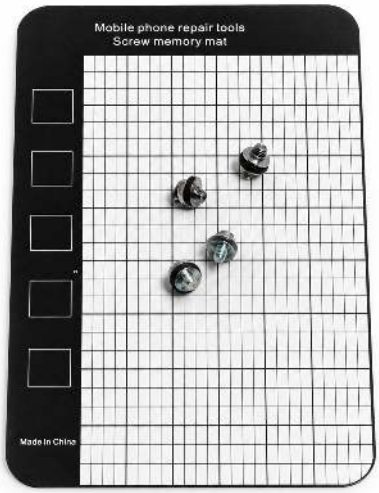

Shut down the PC, unplug power and peripherals, and work on a clean, static-safe surface. This guide assumes the hard drive caddy is already installed or ready to reinstall.

REQUIRED PARTS

2.5-inch SATA HDD • compatible caddy • mounting screws/grommets

2.5-inch SATA hard drive

Mounting screws / rubber grommets

IMPORTANT

The mounting hardware is required for a secure fit. Without it, the drive may shift and disconnect when the PC is moved. Screw type and grommet shape depend on the caddy; confirm compatibility before installation.

1 Install the HDD mounting screws

Fit the compatible mounting screws and rubber grommets into the hard drive mounting holes. These secure the drive in the caddy and help prevent it from moving.

Confirm the screw and grommet type matches your caddy.

2 Lift the caddy latch

Hold the drive caddy securely and raise the black retaining latch as shown.

3 Prepare the open caddy

With the latch raised, locate the drive bay and SATA connector. Keep the latch open while positioning the drive.

4 Insert and secure the hard drive

Lower the 2.5-inch SATA hard drive into the caddy, align it with the connector, then slide it gently into place. Lower the retaining latch until secured.

Do not force the SATA connector or latch.

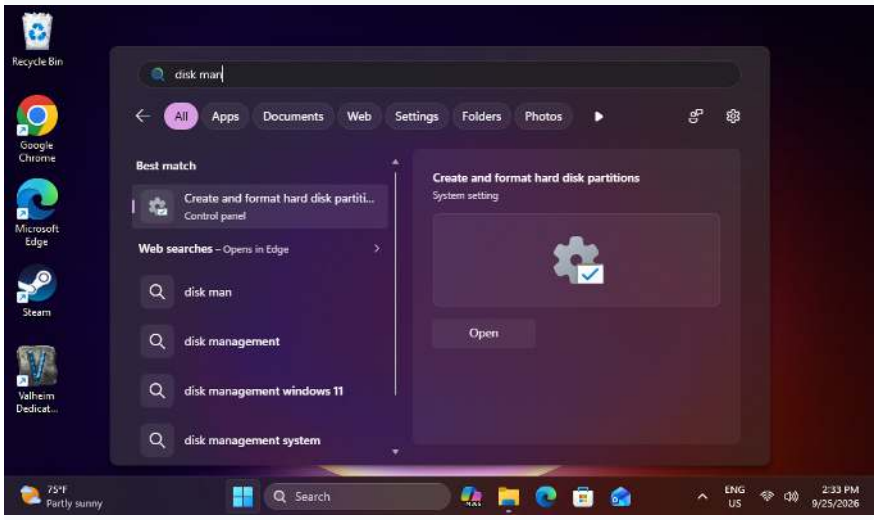

5 Reinstall the caddy assembly

Reinstall the populated caddy into the EliteDesk chassis. Ensure the ribbon cable and optional fan connection are seated as described in the companion caddy-installation guide. Replace the cover and power on.

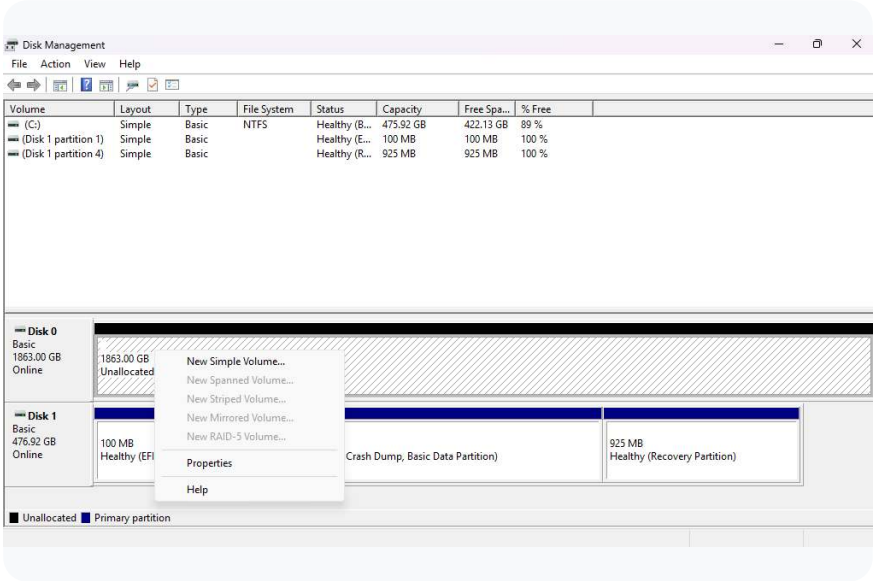

Check cable routing before closing the case.

6 Open Disk Management

Sign in to Windows. Search for “Create and format hard disk partitions” and open the result.

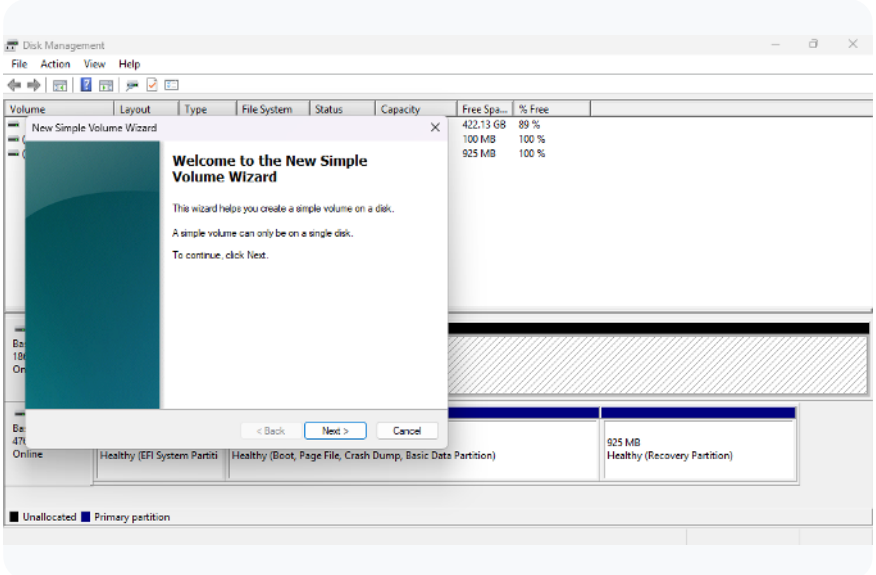

7 Locate the new disk

Find the newly installed drive by its capacity. If it is unallocated, right-click its unallocated area and choose “New Simple Volume.” If prompted, initialize the disk first.

Verify the disk number and capacity. Selecting the wrong disk can cause data loss.

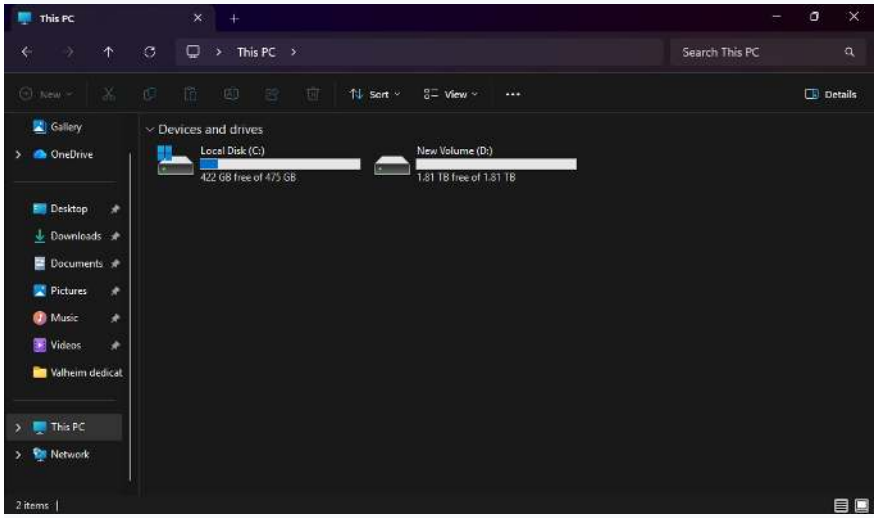

8 Complete the volume wizard

Follow the New Simple Volume Wizard. Choose a volume size, drive letter and file system (typically NTFS for Windows), then finish formatting.

Formatting erases existing data on the selected volume.

9 Verify in File Explorer

Open File Explorer > This PC. Confirm the new volume appears with its assigned drive letter and expected capacity.
